

## ABSTRACT OF THE DISCLOSURE

A single-layer monolithic sealed cremation urn constructed of either acrylic with mineral fillers or an acrylic/polyester blend. The urn is comprised of six pieces, including the top, bottom and four sides. These pieces are assembled with two-part epoxy or other adhesive to achieve an inseparable mechanical and chemical bond. The final piece is bonded in position after the cremation remains have been placed inside the urn. The completed assembly is a fully sealed urn having a solid-surface exterior. A notable feature is that the remains enclosed by the urn are inaccessible except by destroying the urn. Indicia (such as the name and life span of the deceased human or animal) may be etched in relief into the top or side surface(s) to become an integral part of the urn.
